October, 1976

This River Mile Index of the Yellowstone River Basin is the first in a series to be published by the Department of Natural Resources and Conservation. Eventually, we hope to include in these indexes all rivers and streams in the state; work is well underway on the indexes for the Missouri and Columbia Basins. The Department believes that measurement by river mile is the most practical method of measurement along waterways for such purposes as water rights description and scientific investigation, among many others, and makes these indexes available in the hope that they will become a standard by which agencies and individuals can establish measurements by river mile without fear of error or misinterpretation. Mel McBeath, Civil Engineer with the Department's Engineering Bureau, compiled the index.

Measurements were made following the procedures and suggestions set forth in River Mileage Measurement. Hydrology Committee Bulletin No. 14 of the Water Resources Council (Washington, D.C., 1968.) Mileages were derived from U.S. Geological Survey topographic maps, aerial photos, and county projection sheets (2"-to-the-mile township plants projected by the Department from aerial photos.) About 80% of the basin had topographic map coverage (1:24,000 and 1:62,500), and the remaining areas had aerial photo and/or projection sheet coverage (1:31,680.)

All distances in the index (given to the nearest tenth of a mile) were measured from the mouth upstream. The designation "right bank" or "left bank" given to identified features refers to their position in relation to the main stream as it would appear to an observer facing downstream; a "right bank" tributary, for instance, would enter the main stream on the downstream-facing observer's right.

We invite inquiries about the proposed indexes for the rest of the state, which will be made available upon their completion.

Sincerely,

Orrin Ferris, Administrator
Water Resources Division
